

An AI-assisted screening tool that returns evidence a reviewer can act on — not a verdict.

Live prototype: trust-doc-ai.vercel.app · Source: github.com/Hajji-ahmed/TrustDoc-AI

PROBLEM	Official documents are falsified through edited text, replaced photos, forged stamps, altered QR codes — and now through AI generation. Manual review is slow, repetitive, and misses precisely the subtle cases.
TARGET USERS	Teams that verify documents at volume: recruitment, finance, compliance and administration.
EVIDENCE	Three tests run against the working prototype: • AI-generated invoice, visually flawless → scored low risk. • Invalid tax identifier length → missed by the model. • Low score returned with a reject verdict → contradictory output. Each finding changed the build. Interviews are under way to rank use cases.
SOLUTION	Upload → Normalization → Multimodal analysis → Deterministic checks → Risk score → Report A division of labour. The model reads the document and spots visual manipulation. Code counts digits, verifies checksums and re-adds columns — exactly what models fail at. Every flag is drawn and numbered on the document, so the reviewer sees <i>where</i> to look.
PROTOTYPE — LIVE	• PDF, JPG, PNG. Preview and model input are the same image, so flagged regions always align. • Strict JSON schema, re-validated server-side. • Deterministic checks: identifier length, VAT arithmetic, date coherence, IBAN mod-97. • Output: risk score, flagged regions, extracted fields, explanation, recommended action. • Demo mode without an API key. Target architecture, out of 72h scope: OCR tuning, dedicated manipulation models, metadata forensics, cross-document checks.
VALIDATION	Focus: how documents are verified today, which frauds are hardest to catch, and what evidence earns a reviewer's trust. A learning log records who was contacted, what was learned, what was surprising, and what changed as a result.
BUSINESS LOGIC	Customer Organizations verifying documents at volume — lenders, insurers, recruiters, schools, administrations. Value Less manual screening, faster triage, traceable evidence. Model B2B SaaS per seat or per document, plus an integration API. Market Finance, recruitment, insurance, education, public sector. Next 30 days Pilot with one organization, add metadata forensics and cross-document consistency, test pricing.

KEY ASSUMPTION

Organizations will adopt AI-assisted screening only if it shows transparent evidence for every flag. A score without justification will not be trusted — and should not be.
